Phase 3 Randomized Controlled Study of Daratumumab, Bortezomib and Dexamethasone (DVd) vs Bortezomib and Dexamethasone (Vd) in Patients with Relapsed or Refractory Multiple Myeloma (RRMM): CASTOR*

Antonio Palumbo, Asher Chanan-Khan, Katja Weisel, Ajay K. Nooka, Tamas Masszi, Meral Beksac, Ivan Spicka, Vania Hungria, Markus Munder, Maria Victoria Mateos, Tomer Mark, Ming Qi, Jordan Schecter, Himal Amin, Xiang Qin, William Deraedt, Tahamtan Ahmadi, Andrew Spencer, and Pieter Sonneveld on behalf of the CASTOR investigators

Daratumumab: Mechanism of Action

- Human CD38 IgGk monoclonal antibody
- Direct and indirect anti-myeloma activity¹⁻⁵
- Depletes CD38+ immunosuppressive regulatory cells⁵
- Promotes T-cell expansion and activation⁵

Daratumumab: Single-agent Activity

Daratumumab as a single agent

- Approved by FDA and conditionally approved by EMA in relapsed/refractory multiple myeloma^{1,2}
- Patients received a median of 5 prior lines of therapy
 - 86.5% of patients were double refractory to a proteasome inhibitor (PI) and immunomodulatory drug (IMiD)³
- Combined overall response rate (ORR): 31%³
- Median overall survival (OS): 20.1 months³
 - 2-year OS was ~75% in responders
 - Median OS was 18.5 months in patients with MR/SD

MR, minimal response; SD, stable disease; PD, progressive disease; OS, overall survival; CI, confidence interval; NE, not evaluable.

3. Usmani SZ, et al. Blood. 2016. Epub ahead of print.

CASTOR: Study Design

Multicenter, randomized, open-label, active-controlled phase 3 study

 Interim analysis: ~177 PFS events

Daratumumab IV administered in 1000 mL to 500 mL; gradual escalation from 50 mL to 200 mL/hour permitted

RRMM, relapsed or refractory multiple myeloma; DVd, daratumumab/bortezomib/dexamethasone; IV, intravenous; Vel, bortezomib; SC, subcutaneous; dex, dexamethasone; PO, oral; Vd, bortezomib/dexamethasone; PFS, progression-free survival; TTP, time to progression; ORR, overall response rate; VGPR, very good partial response; CR, complete response; MRD, minimal residual disease.

Baseline Demographics and Clinical Characteristics

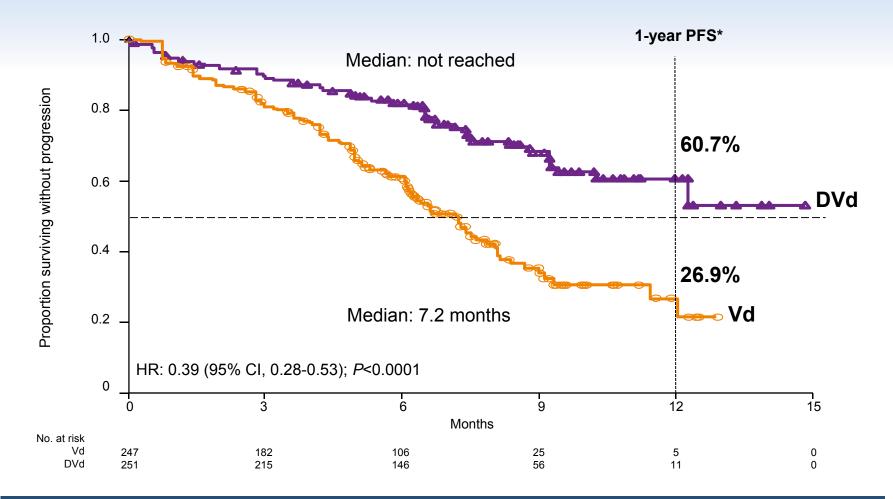

Characteristic	DVd (n = 251)	Vd (n = 247)	Characteristic	DVd (n = 251)	Vd (n = 247)

PFS: 1 Prior Line of Treatment

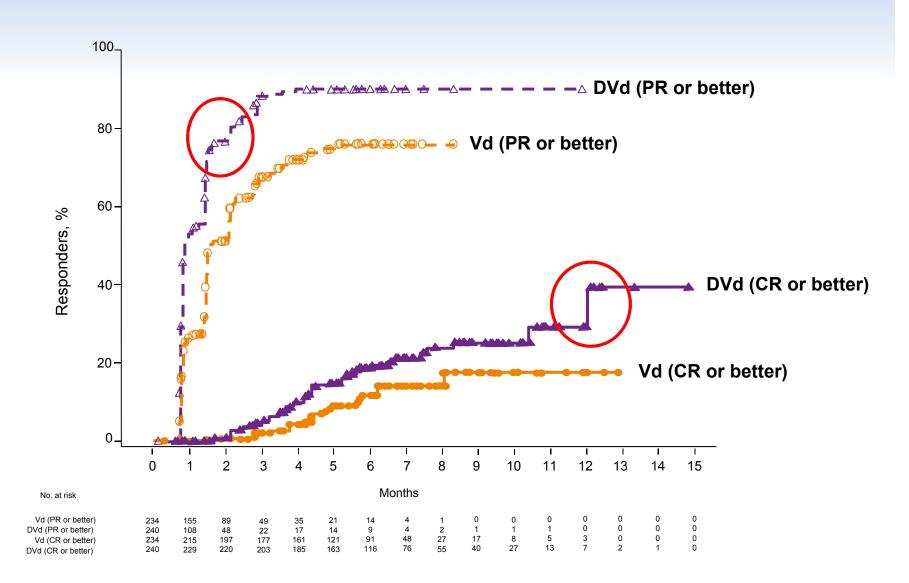

69% reduction in the risk of progression or death for DVd vs Vd

Overall Response Rate^a

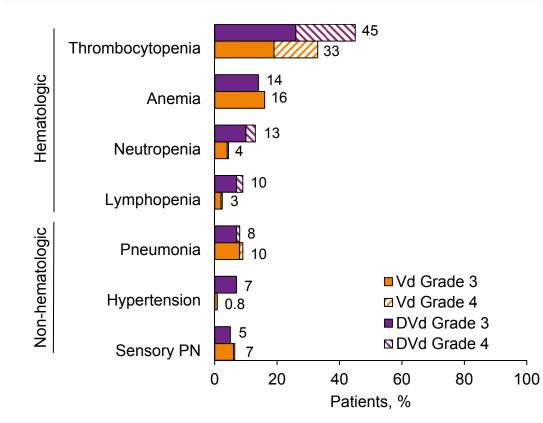

Time to Response

Most Common (≥20%) Treatment-emergent Adverse Events (TEAE)

Patients	DVd	Vd
Number treated	243	237
Patients with TEAE, %		
Thrombocytopenia	59	44
Sensory peripheral neuropathy (PN)	47	38
Diarrhea	32	22
Anemia	26	31
Upper respiratory tract infection	25	18
Cough	24	13
Fatigue	21	25
Constipation	20	16

Most Common (>5%) Grade 3-4 TEAE

Bleeding:

- All grades: 7% in DVd vs 4% in Vd
- Grade 3-4: 3 pts in DVd vs 2 pts in Vd

Infections:

- Grade 3-4 AEs: 21% in DVd vs 19% in Vd
- Serious AEs: 20% in DVd vs 18% in Vd

Discontinued for sensory peripheral neuropathy:

All grades: 0.4% in DVd vs 3% in Vd

Discontinued for TEAE:

7% in DVd vs 9% in Vd

Infusion-related Reactions (IRRs)

	Safety Analysis Set (n = 243)		
	All grades	Grade 3	
Patients with IRRs, %	45	9	
Most common (>5%) IRRs			
Dyspnea	11	2	
Bronchospasm	9	3	
Cough	7	0	

No grade 4 or 5 IRRs observed

- 98% of patients with IRRs experienced the event on the first infusion
- 2 patients discontinued due to IRRs
 - Bronchospasm in the first patient
 - Bronchospasm, laryngeal edema, and skin rash in the second patient

Preinfusion: dexamethasone 20 mg, paracetamol 650-1000 mg, diphenhydramine 25-50 mg Stop infusion immediately for mild symptoms; once resolved, resume at half the infusion rate

Conclusions

- Daratumumab-Vd significantly improved PFS, TTP, and ORR in comparison with Vd alone
 - DVd was associated with a 61% reduction in the risk of progression/death
- Treatment benefit of DVd vs Vd was consistent across subgroups
 - Earlier treatment with DVd may be the most beneficial
- Daratumumab-Vd doubled VGPR and CR rates
- Daratumumab-Vd was not associated with any cumulative toxicities

Conclusions

- Daratumumab-Vd significantly improved PFS, TTP, and ORR in comparison with Vd alone
 - DVd was associated with a 61% reduction in the risk of progression/death
- Treatment benefit of DVd vs Vd was consistent across subgroups
 - Earlier treatment with DVd may be the most beneficial
- Daratumumab-Vd doubled VGPR and CR rates
- Daratumumab-Vd was not associated with any cumulative toxicities

Daratumumab-Vd can potentially be considered a new standard of care for RRMM currently receiving Vd alone
